

Shift API Testing Right with Monitoring

Patrick Poulin
patrick@apifortress.com

Akamai's State of the Internet report found "83% of all web traffic in 2018 was in API traffic."

"Through 2022, at least 95% of cloud security failures will be the customer's fault."

Jay Heiser, VP at Gartner

Examples
HTTP Client

GET → \${protocol}\${domain}\${productsEndpoint}
GET REQUEST
Mode: json Var: productsPayload Expect: Params: {}

Aeq productsPayload.status must be equal to → 200
ASSERT EQUALS
Mode: Level: Execute only if item exists: Stop test if fails:
status is equal to 200

Ai productsPayload.success must be url
ASSERT IS
Mode: Type: url Level: Execute only if item exists: Stop test if fails:
success is a boolean value

Ae productsPayload.content.act must exist
ASSERT EXISTS
Mode: Level: Stop test if fails:
content.act exists

Ai productsPayload.content.products must be array
ASSERT IS
Mode: Type: array Level: Execute only if item exists: Stop test if fails:
content.products is an array

for each in → productsPayload.content.products
the nested assertions will be executed

Variable id
VARIABLE
string: \${_1}

GET → \${protocol}\${domain}\${productEndpoint}
GET REQUEST
Mode: json Var: productPayload Expect: Params: ['id':id]

Aeq productPayload.status must be equal to → 200
ASSERT EQUALS
Mode: Level: Execute only if item exists: Stop test if fails: true
status is equal to 200, if not stop the test

Ai productPayload.success must be boolean
ASSERT IS
Mode: Type: boolean Level: Execute only if item exists: Stop test if fails:
success is a boolean value

Ai productPayload.content.featured must be boolean
ASSERT IS
Mode: Type: boolean Level: Execute only if item exists: Stop test if fails:
content.featured is a boolean value

Ae productPayload.content.name must exist
ASSERT EXISTS
Mode: Level: Stop test if fails:
content.name exists

Ae productPayload.content['_id'] must exist
ASSERT EXISTS
Mode: Level: Stop test if fails:
content._id exists

Ain productPayload.content.type must be in → ['clothing','furniture']
ASSERT IN
Mode: Level: Execute only if item exists: Stop test if fails:
content.type can be either 'clothing' or 'furniture'

Aeq productPayload.content.id must be equal to → \${id}
ASSERT EQUALS
Mode: Level: Execute only if item exists: Stop test if fails:
content.id is equal to id passed as query param

What's a Good API?

Passes Automated Tests
99.8% Functional Uptime

Functional Errors & Uncaught Downtime

How is This Happening?

Who Owns API Functional Uptime?

Monitoring Platform Shortcomings:

1. “Synthetic Testing”

A euphemism for minimal API testing capabilities

3. Using a Different Platform

Tests are written outside of QA by stakeholders with little/no domain knowledge

2. User Profile

People in charge of the monitors aren't testing professionals.

4. Test Intelligence

Tests must capture real consumer flows or user behavior

Problem in a Nutshell

Functional API Monitoring

Automated Testing Team

Monitoring Team

**Let Testing Experts
Monitor APIs**

REDUCE RISK

- They are specialists with domain knowledge
- Catch a wider range of API bugs and vulnerabilities
- 95% of API breaches caused by human error
- Catch and fix functional errors before going live no rollbacks

INCREASE OPS EFFICIENCY

- Increase regression testing without increasing IT resources
- Accelerate time to market
- Improve cross-team collaboration
